Menambahkan codingan card body dan card title untuk menampilkan deskripsi product

A code editor window with a dark background and light blue borders. It displays a React code snippet for rendering a list of product cards. The code uses JSX to create a flex container with a flex-wrap and justify-around layout. Inside, it maps over filtered products to create individual card elements. Each card has a fixed className and contains a figure with an image, a card body with a title and description, and a card actions section.

```
<div className="flex justify-around flex-wrap">
  {filteredProducts.map((product) => (
    <div key={product.id} className="card bg-base-100 w-96 shadow-xl mb-6">
      <figure>
        <img src={product.image} alt={product.title} />
      </figure>
      <div className="card-body">
        <h2 className="card-title">{product.title}</h2>
        <p>{product.description}</p>
        <div className="card-actions justify-end">
        </div>
      </div>
    </div>
  ))}
</div>
```
